

Description:

Packers are used to separate manholes when they are stacked vertically in a yard for storage. They are placed in the tongue and groove joint before the next manhole ring is placed on top. This reduces point to point contact which can caused products to crack, especially when the concrete has not fully hardened.

The main advantages of the packers are;

- ▶ High quality plastic prevents cracking in cold weather
- ▶ Material is resistant to a wide range of chemicals (material datasheet available on request)
- ▶ Made with some recycled material

The packers are available in the following sizes;

Code	Dimensions (mm)	Thickness (mm)
SP108	47 x 18	10
SP109	47 x 18	15
