

Description:

This product allows multiple padlocks to be fitted in place of a single padlock. This ensures that an access gate or similar cannot be locked until all personnel are clear and have removed their personal padlock. It can also be used in the locked position to restrict lone working. More than one padlock has to be removed before the gate can be opened. This is compatible with the Caswick grate.

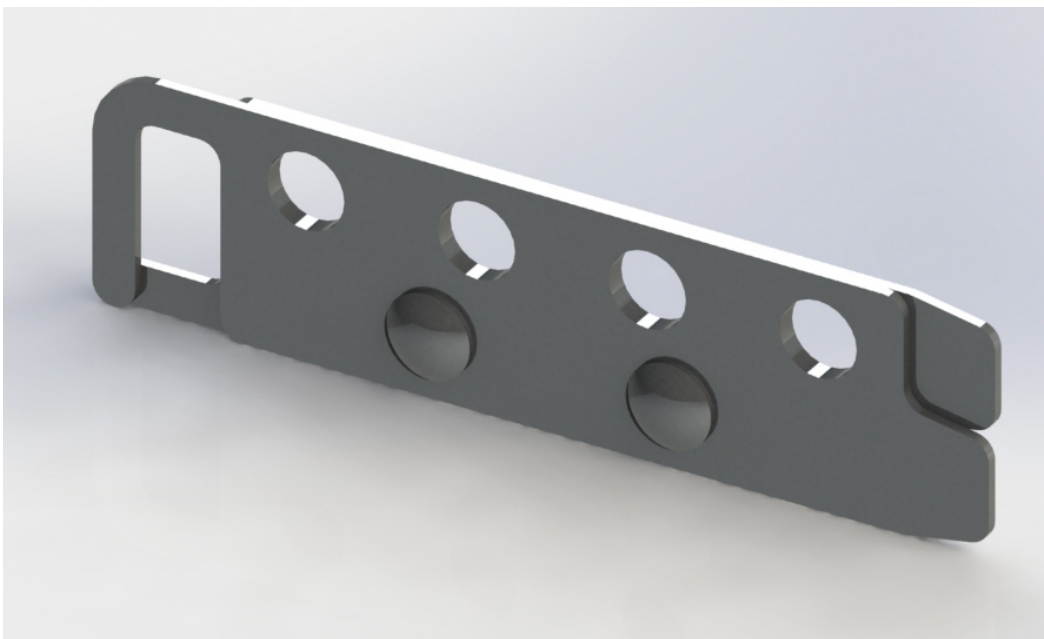

Lockout Hasp

The main advantages of the lockout hasp are;

- › Helps to prevent personnel from being inadvertently trapped inside a restricted area as part of a safe system of work
- › Helps to restrict single person working
- › Can be put in place of a single padlock to allow up to 4 padlocks to be used
- › Can be chained together if more than 4 padlocks are required
- › Manufactured from 304 stainless steel for corrosion resistance
- › Can be used in conjunction with the Caswick Grate and Riser frame

In the open position the hasp can be hooked through standard padlock features

Sliding the hasp closed secures it so that it cannot be removed and reveals the four holes to allow personal padlocks to be fitted to secure the hasp and prevent its removal
